

# What are the *impacts* of *Climate Change* on the *Kiribati Islands?*

This text is about the impacts of Climate Change on the Kiribati Islands and how it is affecting them.

To begin, the ability to fish is being impacted a lot on the

Kiribati Islands. I know this

because in the text it said that fish are moving to cooler waters. This is because of the

ocean warming. Consequently, the I-Kiribati people don't have much to eat. Additionally, with

the sea levels rising salt water is going underground and is killing the roots of many plants and trees. According to the text it says that with the saltwater rising are making coconut trees die. Therefore, the I-Kiribati people don't have much food at all. Finally, the the access of fresh water is being impacted. The main water sources

are getting washed away. I know this because in the text it said that rising sea levels are washing away fresh water pipes and wells. Now the I-Kiribati people are drinking saltwater. Climate Change is really hurting the Kiribati Islands. We need to help!
